

Air-to-water heat pumps

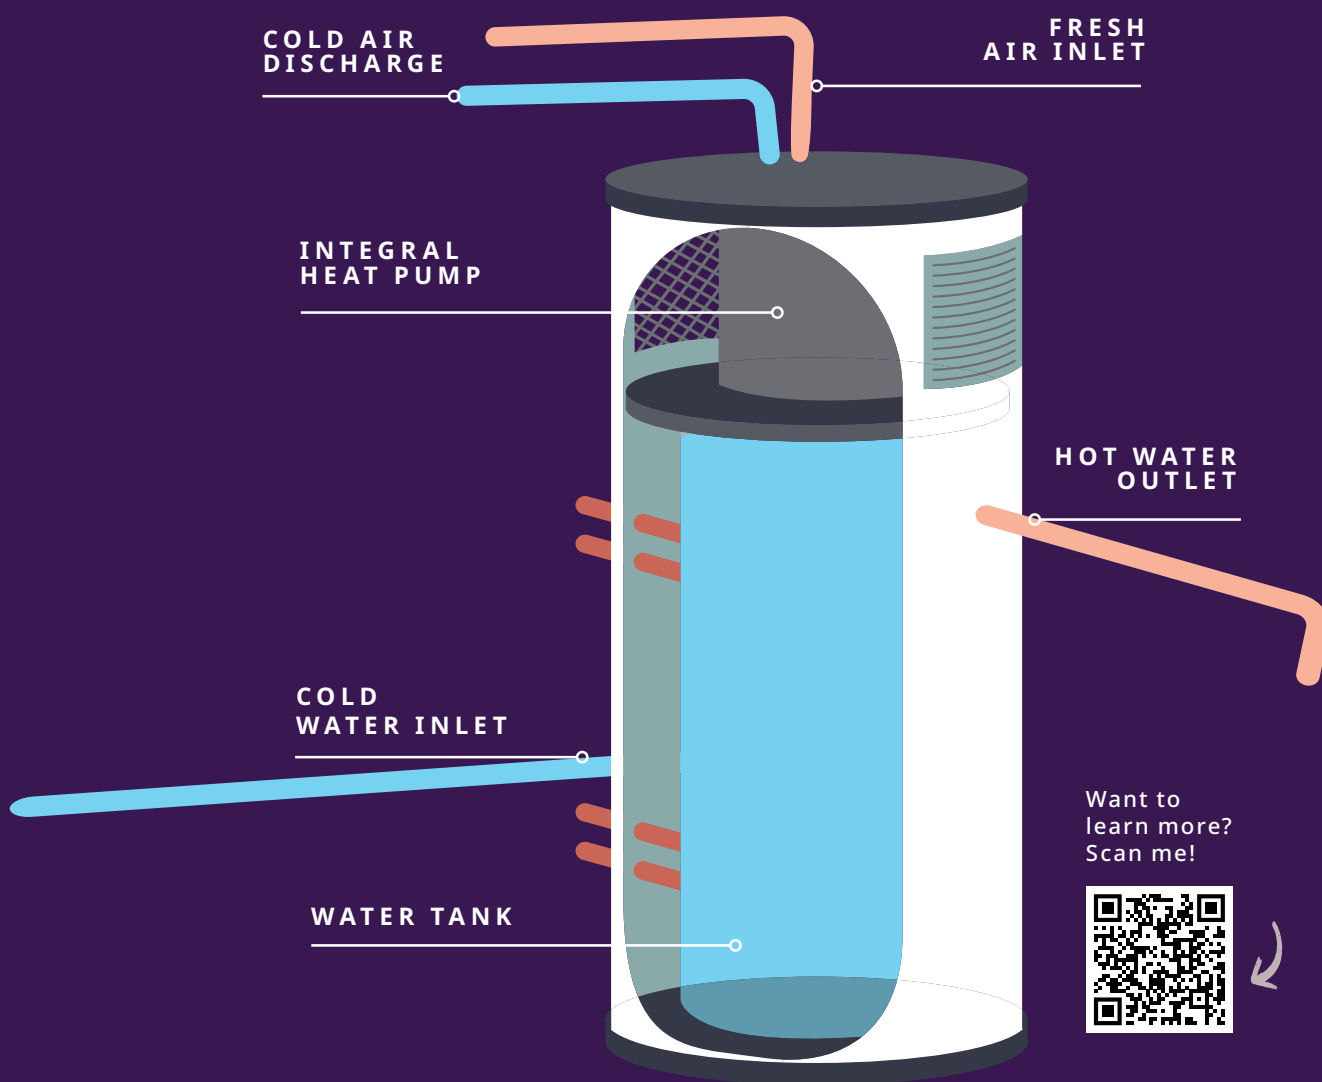

Learn more about how this can provide
hot water in your home.

Taylor
Wimpey

How does an air-to-water heat pump work?

A heat pump cylinder looks like a traditional hot water cylinder, but it has a discrete integral heat pump mounted on top. It can provide hot water very efficiently, working like a traditional air source heat pump, extracting heat from external fresh air via insulated ducting to provide hot water directly into the cylinder.
